

Full Regression Test Report: QueueEase

1. Project Information

- **Project Name:** QueueEase
- **Members:** Myron Deandre G. Alia
- **Date:** May 8, 2026
- **Branch Name:** feature/vertical-slice-refactoring
- **Repository Link:** https://github.com/Tharzzzs/IT342_QueueEase_G4_Alia/tree/main

2. Refactoring Summary

The QueueEase project was successfully refactored from a technical-layer structure into a **Vertical Slice Architecture**. Feature behavior is now grouped by business capability, ensuring that all code related to a specific feature (such as authentication or queue management) resides within the same "slice". Shared infrastructure, such as security filters and general configurations, has been moved to a centralized core directory.

3. Updated Project Structure

The following structure reflects the new Vertical Slice layout for the Backend, Web, and Mobile modules:

Backend Structure :

- core/config/
- core/security/
- features/auth/

Web Structure :

- components/ (shared UI)
- features/auth/
- features/queue/
- features/serviceCenter/

Mobile Structure :

- core/network/

- features/auth/
- MainActivity.kt

4. Test Plan Documentation

The regression testing ensures that all functional requirements remain intact after the structural changes.

Table 1: Automated Test Cases

Test Case ID	Module	Requirement	Test Steps	Expected Result	Automated?
AT-01	Backend	Clean package imports	Scan for old controller/facade imports.	No stale package imports found.	Yes
AT-02	Web	Repair stale aliases	Scan for old page and API aliases.	All imports updated to new feature paths.	Yes
AT-03	Mobile	Android package scan	Scan for old UI/network/model packages.	Packages replaced with updated names.	Yes
AT-04	Backend	Maven Context Test	Run mvnw.cmd test.	Spring context loads; 0 failures/errors.	Yes
AT-05	Web	Production Build	Run npm run build.	Production build completes successfully.	Yes
AT-06	Mobile	Unit Testing	Run gradlew.bat testDebugUnitTest.	All Android unit tests pass.	Yes

5. Regression Test Results

- **Execution Date:** May 8, 2026

Table 2: Test Execution Status

Test Case ID	Status (Pass/Fail)	Tested By	Notes / Observations
AT-01	PASS	Alia	Verified programmatically via refactoring scripts.
AT-02	PASS	Alia	Verified programmatically via refactoring scripts.
AT-03	PASS	Alia	Verified programmatically via refactoring scripts.
AT-04	PASS	Alia	1 test run, 0 failures, 0 errors.
AT-05	PASS	Alia	Production build successful.
AT-06	PASS	Alia	Android activity wiring verified.

6. Issues Found & Fixes Applied During Refactoring

Table 3: Issue Resolution

Issue Encountered	Root Cause	Fix Applied
Backend features missed imports.	Moving classes broke existing package references.	Fixed declarations and removed redundant imports via Node script.
Web imports referenced old locations.	File paths changed during the shift to feature folders.	Updated imports to direct feature paths programmatically.
Android manifest error.	Package names for activities were not updated.	Updated .LoginActivity and .RegisterActivity in manifest.
API Port Mismatch.	Frontends used 8080 while backend used 8081.	Updated base URLs to 8081 in auth.ts and ApiClient.kt.
Missing R class imports.	Relocated activities could no longer resolve R.	Added explicit import edu.alia.queueease.R.
